2019-2020 Deer Harvest Summary Report

Harvest Summary

2019-2020 Deer Harvest by Management Zone

Zone	Bucks	Does	Total
18-49	113	77	190
Archery	22	17	39
SAIA	8	27	35
All Areas	143	121	264

USAG, Fort Gordon, Georgia

2019-2020 Deer Harvest Summary Report

2019-2020 Deer Harvest By Age Class

Harvest of “Mature” bucks this season is about half of what it was last season. Roughly 80% of bucks harvested and 70% of does harvested were aged to be 3.5 yrs old or younger. The total number of fawn (0.5 yr old) bucks and does harvested this season is half of what it was last season, so that is a positive. Thanks to all those who submitted jawbones as required.

U.S. ARMY

Antlerless Harvest Quota (TAs 18-49)

- ✓ The Antlerless Harvest Quota for training areas 18-49 was initially set at 50, which was reached on 11 November
- ✓ Again this season, after receiving favorable results from our Fall Camera Survey, the quota was increased to include an additional 30 antlerless deer. This extended quota was met on 2 January

2019-2020 Deer Harvest Summary Report

Antler Data

2019-2020 Average Antler Characteristics

Age	Sample Size	Points	Inside Spread	Gross B and C	Live Weight
1.5	6	2.5	7.1	33.5	99.2
2.5	7	7.9	10.6	79.6	120.7
3.5	25	8.7	14.2	103.7	143.0
4.5	6	9.0	15.7	115.4	146.3
5.5	3	9.0	16.0	129.2	149.7
6.5+	2	8.5	14.6	109.8	145.0

This antler data represents approximately 35% of the total bucks harvested. Thanks to those hunters who allowed NRB biologists to measure their bucks.

2019-2020 Deer Harvest Summary Report

Kidney Fat Index

Kidney Fat Index (KFI) is a measurement of the amount of fat on the kidneys of harvested deer. Biologists use this index to assess the health of individual deer as well as the health of the entire deer herd. KFI is measured on a scale of 1-4 with 1 being poor and 4 being excellent. Kidney fat for both bucks and does harvested in 2019-2020 season averaged in the fair range. Kidney fat can be highly variable between individual deer depending on rutting activity, lactation, and local habitat quality.

2019-2020 Average KFI of Harvested Deer

	<u>Avg KFI</u>	<u>Sample Size</u>
Bucks	2.2	21
Does	2.2	19

Annual Trends

Average Weights of Yearling Deer

Tracking yearling deer weights from year to year is one way NRB biologists evaluate herd health and habitat quality. This is one reason for requiring submission of jawbones from all harvested deer. Thanks to everyone who submitted jawbones.

USAG, Fort Gordon, Georgia

2019-2020 Deer Harvest Summary Report

Annual Trends

Fawn Harvest Trend

While most hunters would agree that limiting fawn harvest would help grow the population, having some fawns in the harvest is not bad. The percent of fawns in the harvest can be used as an index of population status and growth rate. More fawns in the harvest may indicate more fawns in the population.

USAG, Fort Gordon, Georgia

2019-2020 Deer Harvest Summary Report

Annual Trends

Average Kidney Fat Index

While many factors such as pregnancy, lactation, rut, habitat, etc. can effect a deer's kidney fat, having a stable KFI trend between 2.5 – 3 shows that overall herd health is good. (See slide 11 for an explanation of Kidney Fat Index)

Peak Conception Dates (Since 2010)

- ✓ Based on fetus data collected since 2010 the average date of conception is **29 October**
- ✓ The range is 10 October to 1 December, with approximately 2/3 of conceptions fall in the first half of this range based on samples we have collected (Sample Size: 28)
